More Tourists, More Profit?

A comparison of short-term and long-term renting in Bergamo, Italy

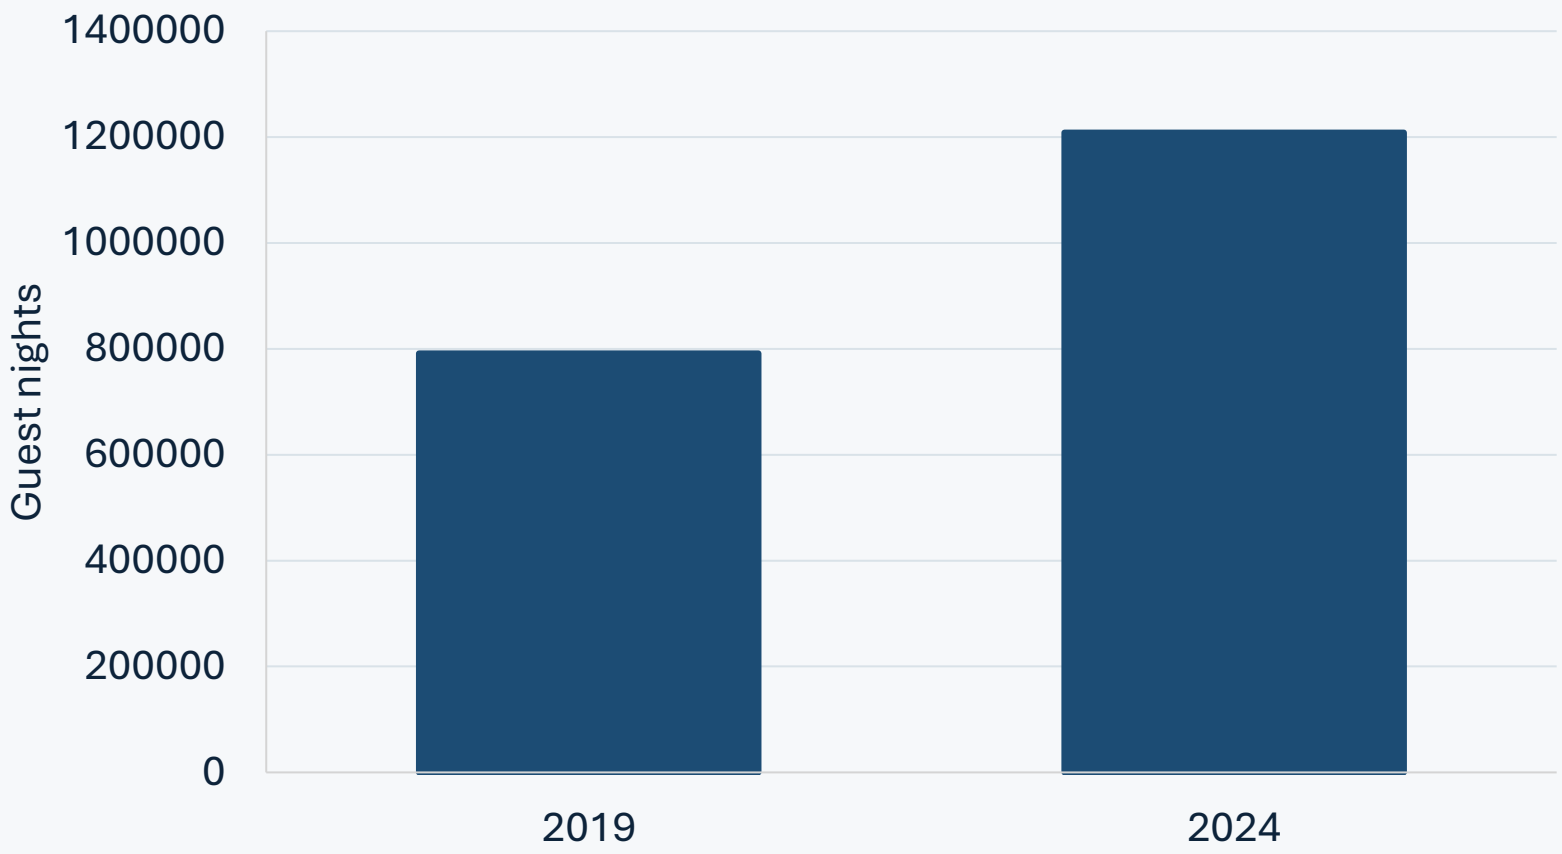

DATA ANALYTICS CASE STUDY

Tourism demand
Owner cash income
The cost of conversion

Pedram Kojouri
October 2026

Tourism is growing. What does an owner keep?

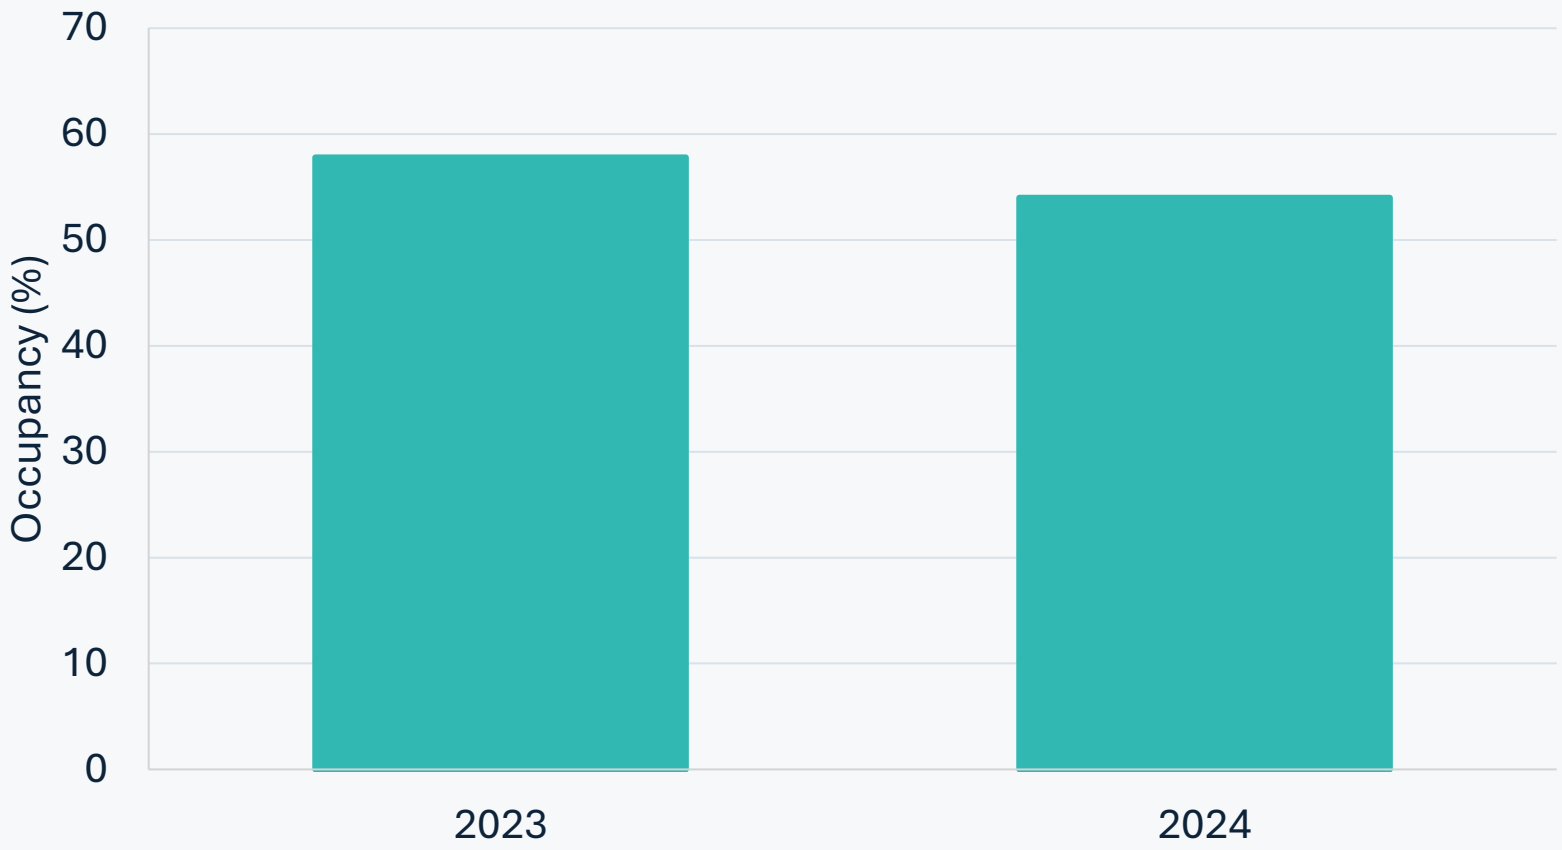

City guest nights increased by 52.7% between 2019 and 2024.

Source: Regione Lombardia, city aggregate tourism data. Market growth alone does not establish a rental profit advantage.

Demand growth and occupancy can diverge

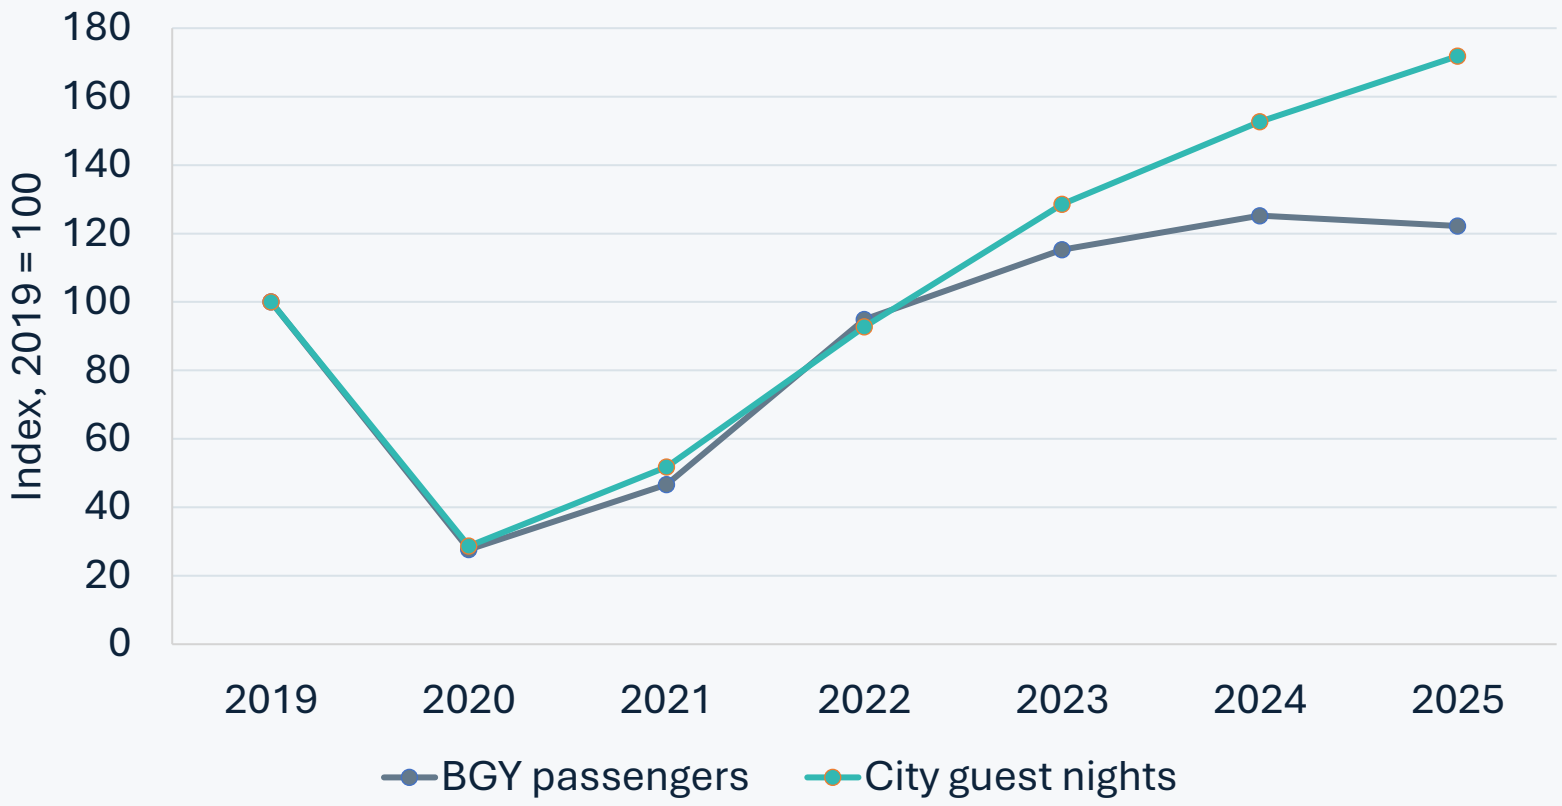

Historical estimated Airbnb occupancy fell 3.8 percentage points in 2024.

Source: FULL research using AirDNA estimates. All-listing city benchmark, not a matched apartment cohort.

Airport activity is a contextual signal

2025: BGY passengers −2.4%, city guest nights +12.6%.

Sources: Assaeroporti and official city tourism releases. Passenger movements do not identify tourists staying locally. No causal effect estimated.

A close cash comparison

Annual net cash income under the base scenario

SHORT-TERM

€6,545

LONG-TERM

€6,732

Scenario values, not city averages. STR: 180 nights, €115 gross rate, owner-paid cleaning. LTR: €900/month, 12 paid months. Actual gap €187.50.

Price and bookings change the result

Short-term annual net cash income, EUR

Booked nights	€100/night	€115/night	€130/night
150	3,525	4,954	6,383
180	4,830	6,545	8,259
210	6,135	8,135	10,136

Long-term baseline: €6,732/year

Conditional combinations. Higher prices may reduce bookings.

Conversion raises the required bookings

At €115 gross nightly revenue

Source: scenario model. Additional setup cost above the long-term alternative, recovered over five years. Thresholds round upward.

The difficult part was comparability

Data validation and assumptions determine how much we can conclude.

27 guest nights

October discrepancy between two official 2024 releases. Kept visible instead of silently pooled.

21 candidates, 6 primary offers

Separate contract durations and serviced units. The 15–30 comparable-offer target remains unmet.

Skills demonstrated: source reconciliation, time-series joining, financial modelling and sensitivity analysis.

A conditional business opportunity

The evidence supports testing the economics of the same property before conversion.

Growth creates demand.
Costs and alternatives determine retained cash.
